Godliness Dongorere

Programmer | .NET, APIs & Enterprise Integration

+268 7934 2380 godlinessdongorere@gmail.com linkedin.com/in/gdongorere github.com/geehyness godliness.vercel.app

Software engineer with 3+ years building and integrating enterprise systems on Microsoft .NET, SQL Server and PostgreSQL. Built an ASP.NET Core (.NET 9) REST API with JWT authentication, role-based access, rate limiting, audit logging and scheduled SQL Server ETL pipelines for national health indicators, and integrated payment platforms (PayFast) with signature verification and server-side validation. At Palladium I designed an AI assistant that queries data only through an MCP tool, keeping the model away from the database and PII out of responses. Works in Agile delivery with Git and CI/CD, applies secure-coding practice, and uses AI-assisted and agentic development tools daily. BSc Computer Sciences and Informatics. Authorized to work in Eswatini with a valid permit.

TECHNICAL SKILLS

Programming & Development

C# | .NET Framework | Modern .NET (.NET 9) | ASP.NET Core | Entity Framework Core | Dapper | Python | Java | JavaScript | TypeScript | HTML5 | CSS3 | AngularJS | React | Next.js | Node.js | FastAPI

Databases

Microsoft SQL Server | SQL Server Management Studio | PostgreSQL | SQL (views, ETL, query tuning) | MongoDB

Integration

REST APIs | OpenAPI / Swagger | Payment platform integration (PayFast) | Third-party & mapping APIs | EMR / device integration | Batch & scheduled ETL | System Integration

DevOps & Automation

Git | GitHub Actions CI | CI/CD pipelines | Automated testing (Vitest, Playwright) | Microsoft Azure | Structured logging (Serilog)

Security

Secure coding | JWT / OAuth 2.0 bearer flows | API security | Password hashing (BCrypt) | Rate limiting | Payment signature validation | PII reduction

AI-Assisted Development

AI coding assistants | Agentic programming tools | Model Context Protocol (MCP) | Local LLMs (Ollama) | Development automation

Mobile

Android Studio | React Native | Progressive Web Apps

PROFESSIONAL EXPERIENCE

Software Engineer

February 2026 - September 2026

Palladium: Make It Possible

- Developed and integrated APIs and contributed to architectural design on Microsoft Azure using .NET and AngularJS, working in a multi-stakeholder project team
- Built the SQL Server data layer behind the dashboards (SSMS) and analytics views in Apache Superset
- Designed an AI assistant for Power BI dashboards using a Model Context Protocol (MCP) tool that generates DAX queries, so the model never had direct database access
- Returned processed, aggregated data only, keeping personally identifiable information out of AI responses (data protection by design)
- Built an AI system within CMIS to identify patients who had interrupted treatment, supporting follow-up prioritisation

Software Engineer

January 2025 - Present

Synapse Digital

- Build, test and ship full-stack web applications end to end with Next.js, React, Node.js and TypeScript, PostgreSQL and MongoDB, with automated lint, type-check, unit and browser tests in a GitHub Actions CI pipeline
- Integrate third-party APIs and payment and mapping services; apply AI to analyse data and automate processes
- Built a multi-restaurant POS platform and a retail inventory system with REST backends, authentication and payment flows, turning business owners' needs into technical specifications
- Manage projects from requirements to delivery in iterative cycles, and maintain technical documentation

Systems Engineer

May 2023 - September 2025

The Luke Commission

- Developed and maintained integrations between medical devices, EMR systems and operational dashboards, with real-time and batch data exchange
- Managed critical healthcare systems including Electronic Medical Records (EMR), resolving integration and hardware/software faults with minimal downtime
- Built the Oxygen Plant Dashboard (SCADA Ignition) and programmed Siemens PLCs in TIA Portal with Profinet slaves, integrating with existing infrastructure
- Built OutSystems applications for organisational processes; provided ICT support to medical and administrative staff

Freelance Android Developer

YukiSoft

- Developed Android mobile applications as a freelance developer

Technical Support Specialist

March 2022 - December 2022

Ka-Zakhali Private School

- Developed a custom reporting system for school reports, addressing data accuracy and accessibility challenges
- Provided ICT support and taught Computer Application Technology to Grade 9-12 students

KEY PROJECTS

Eswatini Health Indicators API (ASP.NET Core, .NET 9) *Health data platform*

Problem: Programme indicators for HIV testing, PrEP and ART treatment sat in source SQL Server tables, with no secure, consistent API for dashboards.

Solution: Secured REST API with JWT authentication, API-key protected ETL triggers, rate limiting, request logging (Serilog), health checks and Swagger/OpenAPI, backed by SQL Server via EF Core and Dapper.

Contribution: Designed and built the API and three ETL services (HTS, PrEP, ART) with batch IDs, de-duplication and scheduled runs, SQL scripts and views, BCrypt password hashing and an encryption service.

POS & Payments API (FastAPI) *Collaboration with Carte*

Problem: Independent restaurants needed affordable, centralised POS, inventory, HR and online payments.

Solution: REST API covering orders, inventory, payroll and payments, with JWT / OAuth2 bearer authentication and PayFast ITN payment integration.

Contribution: Built the backend, MongoDB data model and PayFast integration (signature verification plus server-side validation of payment notifications).

AI Decision Support in CMIS: Interrupted-in-Treatment Patients *Palladium: Make It Possible*

Problem: Patients interrupting treatment were hard to identify and follow up from routine health information system data.

Solution: AI system within CMIS plus an AI assistant alongside Power BI dashboards that answers questions in natural language.

Contribution: Built the system; the assistant uses an MCP tool to generate DAX queries so the model has no database access and PII is minimised.

GateTrack - Secure Gate & Asset Management PWA *Personal project*

Problem: Gate officers needed reliable visitor and asset tracking, including when offline.

Solution: Role-based React/TypeScript PWA with QR scanning, visitor badges, asset transfer and an offline sync queue.

Contribution: Full-stack design and development.

More projects at godliness.vercel.app and github.com/geehyness.

EDUCATION

Bachelor of Science in Computer Sciences and Informatics, University of Johannesburg — Graduated December 2020
